Installation procedure for *RapCool*  
High Performance PMD Isolator Kit

REMOTE-MOUNT HEAT & VIBRATION ISOLATING SYSTEM

## INSTALLATION PROCEDURES

The RapCool PMD ISOLATOR system remotely mounts the PMD away from the engine compartment for superior cooling, maximum performance and reliability.

The PMD Isolator system is a very durable design not affected by the elements.

Next, plug the special ISOLATOR harness into the PMD and route the harness up to the left front of the engine.

The next step is to release the latch holding the factory pump harness to the PMD (Pump Mounted Driver) mounted on the driver's side of the fuel injection pump. When the latch is released, the connector will move backwards and out of its connection to the PMD.

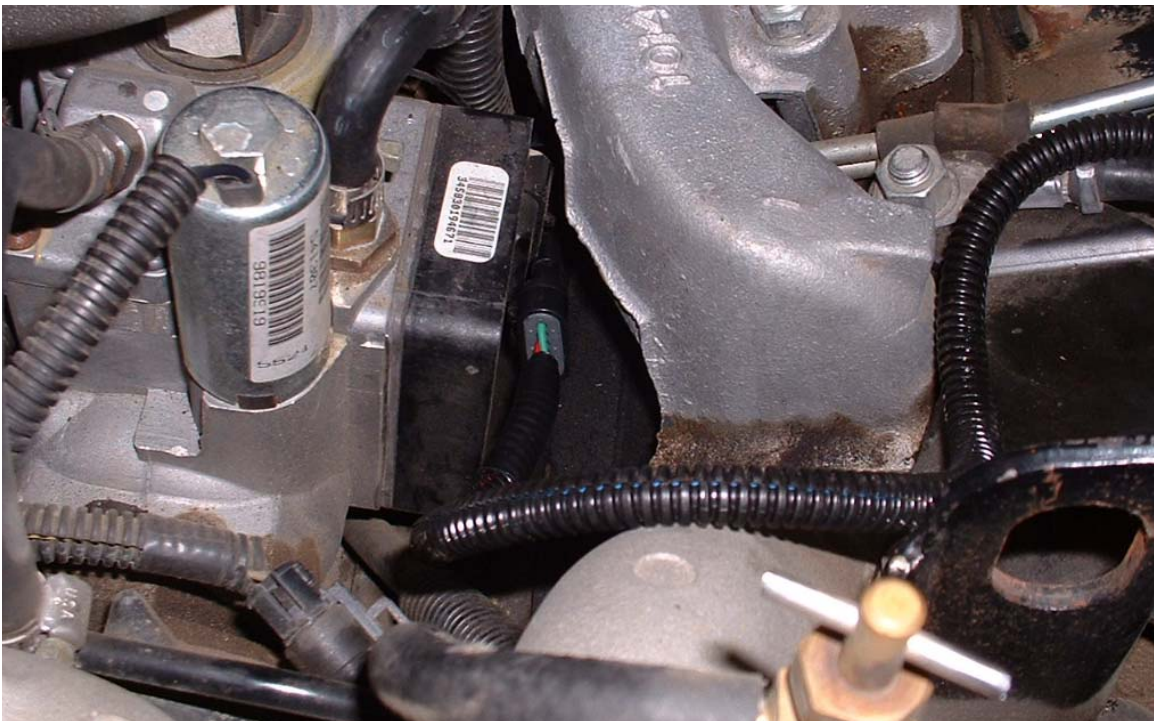

Pull the pump harness up and out into the open area.

Remove and discard the blue-colored seal from the pump harness connector.

Connect the ISOLATOR harness to the pump harness connector.

Route harness over to new PMD Isolator located on the drivers side front splash shield.

Next install the PMD Isolator spacer plate under the hood prop mount by removing the 4 bolts holding the hood prop in place and inserting the spacer plate behind the prop mount.

Install the PMD Isolator assembly by removing the 4 bolts and washers on the back side. Hold PMD against

the splash shield. Next have an assistant lower the hood allowing the hood prop to rotate clear of the PMD. This is important to find the correct location to allow the hood prop to freely clear the PMD.

Locate the four mounting locations and carefully drill 4 ½" holes. Install the PMD assembly using a washer on each side of the plastic splash shield.

Plug wire harness into PMD.
